No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Zinchenko V.V., Churin Y., Shestopalov V.I., Shestakov S.V.;
"Nucleotide sequence and characterization of the Rhodobacter sphaeroides glnb and glna genes.";
Microbiology 140:243-2151(1994).
-!- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GLUTAMINE SYNTHETASE GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I TO NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA, WHEN P-II IS URIDYLYLATED TO P-II-UMP, THESE DECREASES, P-II IS URIDYLYLATED TO P-II-UMP, THESE DECREASES, P-II IS URIDYLYLATED TO P-II-UMP, WHICH CAUSES THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE, SO ACTIVATING THE ENZYME.
-!- SUBUNIT: HOMOTRIMER (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE P(II) PROTEIN FAMILY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-NOV-1995 (Rel. 32, Created)

J. Bacteriol. 170:3125-3130(1988).

-i- CATALYTIC ACTIVITY: 2 ATP + L-glutamine + CO(2) + H(2)O = phosphate + L-glutamate + carbamoyl phosphate.

-i- COFACTOR: Binds three manganese ions (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CARB_METBA

                                                                                                                                                                                              PATHWAY: Pyrimidine biosynthesis; first step.
SUBUNIT: Composed of two chains; the small (or glutamine) chain promotes the hydrolysis of glutamine to ammonia, which is used by the large (or ammonia) chain to synthesize carbamoyl phosphate.
SIMILARITY: BELONGS TO THE CARB FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PF00543; P-II; 1

CAN BIND MULTIPLE CELLULAR TARGETS.

TISSUE SPECIFICITY: EXPRESSED IN ALL TISSUES ANALYZED, INCLUD: HEART, BRAIN, PLACENTA, LUNG, LIVER, SKELETAL MUSCLE, KIDNEY & PANCREAS. EXPRESSED IN ALL EPITHELIAL AND FIBROBLASTIC LINES EXAMINED AND IN SOME, BUT NOT ALL, HEMATOPOIETIC CELLS.

PTM: PHOSPHORYLATED BY SEVERAL RECEPTOR TYROSINE KINASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Loca L

J. Biol. Chem. 272:10353-10360(1997).

-i- FUNCTION: TRANSFERS MYRISTATE OR LAURATE, ACTIVATED ON ACP, TO THE LIPID IVA MOIETY OF (KDO)2-(LAUROYL)-LIPID IVA. DECANOYL, PALMITOLEOYL, AND (R)-3-HYDROXYMYRISTOYL-ACP ARE POOR ACYL DONORS. FUNCTIONS OPTIMALLY AFTER LAURATE INCORPORATION BY HTRB HAS TAKEN PLACE. ACYLATES (KDO)2-(LAUROYL)-LIPID IVA ABOUT 100 TIMES FASTER THAN (KDO)2-LIPID IVA. DISPLAYS A PREFERENCE FOR MYRISTOYL-ACP OVER LAUROYL-ACP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        EcoGene; EG10614;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CPSA_HUMAN
                                                                                                                                                                  POLY(A) ADDITION. THE SUBUNIT IS INVOLVED IN THE RACORITION,
POLY(A) POLYMERASE AND OTHER RACTORS TO BRING ABOUT CLEAVAGE AND
POLY(A) ADDITION. THIS SUBUNIT IS INVOLVED IN THE RNA RECOGNITION
STEP OF THE POLYADENYLATION REACTION.
1. SUBUNIT: CPSF IS A HETEROTETRAMER COMPOSED OF FOUR DISTINCT
SUBUNITS 160, 100, 70 AND 30 kDa.
1. SUBCELLULAR LOCATION: NUCLear; nucleoplasm.
                                                                                                                                                                                                                                                                                                                          Murthy K.G., Manley J.L.;
"The 160-kD subunit of human cleavage-polyadenylation specificity factor coordinates pre-mRNA 3'-end formation.";
Genes Dev. 9:2672-2683(1995).

"Cleavage and polyadenylation factor CPF specifically interacts with
the pre-mRNA 3' processing signal AAUAAA.";

EMBO J. 10:4241-4249(1991)

----

FUNCTION: CPSF PLAYS A KEY ROLE IN PRE-MRNA 3'-END FORMATION,
RECOGNIZING THE AAUAAA SIGNAL SEQUENCE AND INTERACTING WITH
POLY(A)POLYMERASE AND OTHER FACTORS TO BRING ABOUT CLEAVAGE AND
POLY(A) ADDITION. THIS SUBUNIT IS INVOLVED IN THE RNA RECOGNITION
STEP OF THE POLYADENYLATION REACTION.
